# 4+1 View Model

# About Kruchten and this paper

- Philippe Kruchten
  - Over 16 years of experience as the leader of RUP development team in Rational corp. (now owned by IBM)
  - Valuable experiences in industry (Telecom, Air traffic control system) which he used them for confirmation of his model
- The "4+1 view model" paper:
  - 60 citations according to ACM portal site

#### **Architectural view**

 An architectural view is a simplified description (an abstraction) of a system from a particular perspective or vantage point, covering particular concerns, and omitting entities that are not relevant to this perspective

#### **Problem**

- Arch. documents over-emphasize an aspect of development (i.e. team organization) or do not address the concerns of all stakeholders
- Various stakeholders of software system: end-user, developers, system engineers, project managers
- Software engineers struggled to represent more on one blueprint, and so arch. documents contain complex diagrams

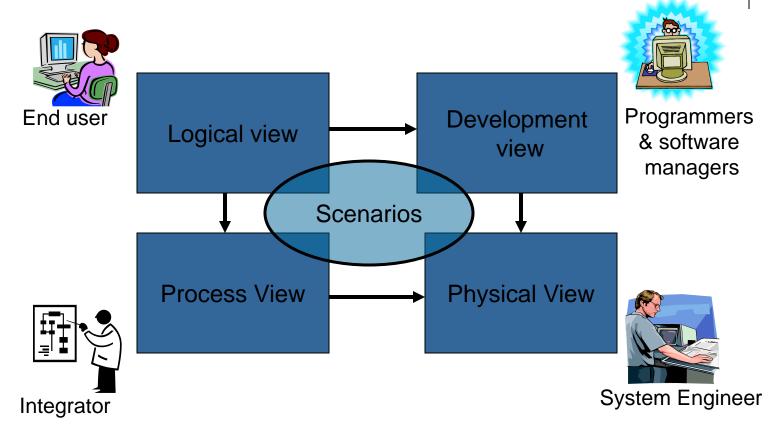

### Solution

- Using several concurrent views or perspectives, with different notations each one addressing one specific set for concerns
- "4+1" view model presented to address large and challenging architectures

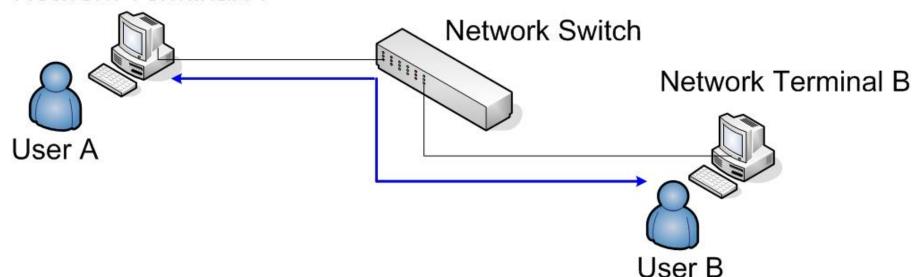

#### 4+1 View Model of Architecture

A Case: Software Architecture of a Network Application System --- NAS

#### Network Terminal A

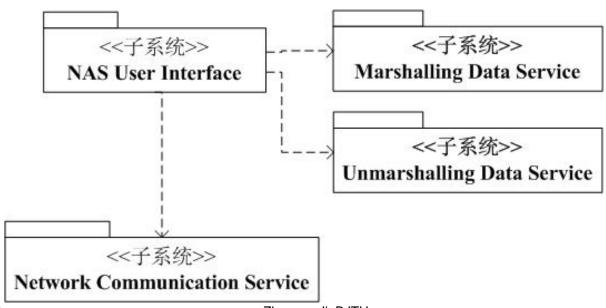

#### **Requirements:**

- Terminals receive the input data from users.
- Terminal A formats the input data, and sends the formatted data to Terminal B by network.
- Terminal B parses the formatted data, and represent them to users in the screen.

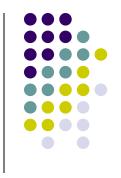

#### Logic View

The functional abstraction of system. It mainly focused on dividing the System into several functional components and describe their functional relationships.

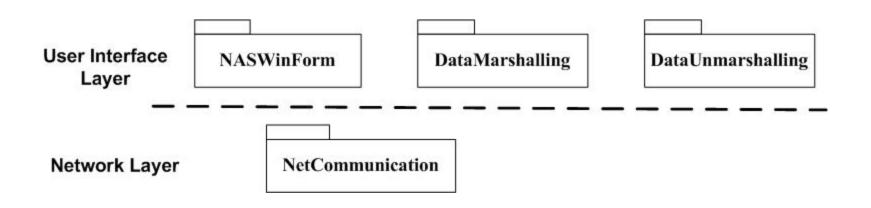

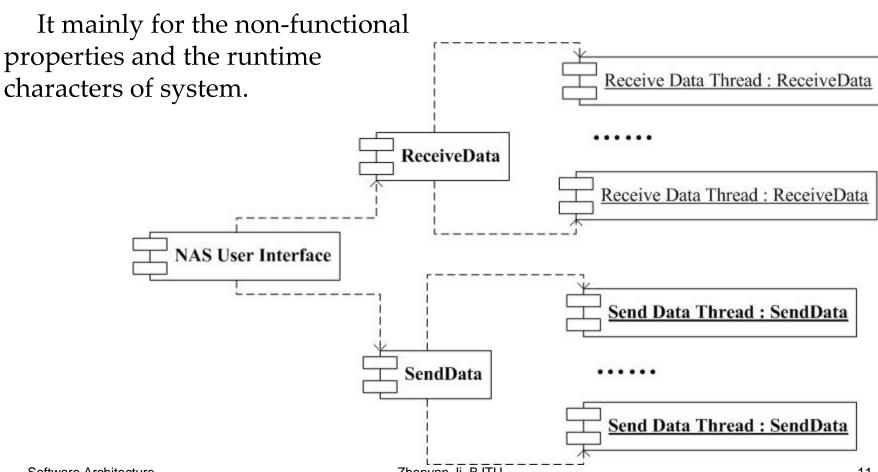

#### Development View

The detailed design and construction abstraction of system. It mainly gives a general structure of system for the detailed design and construction.

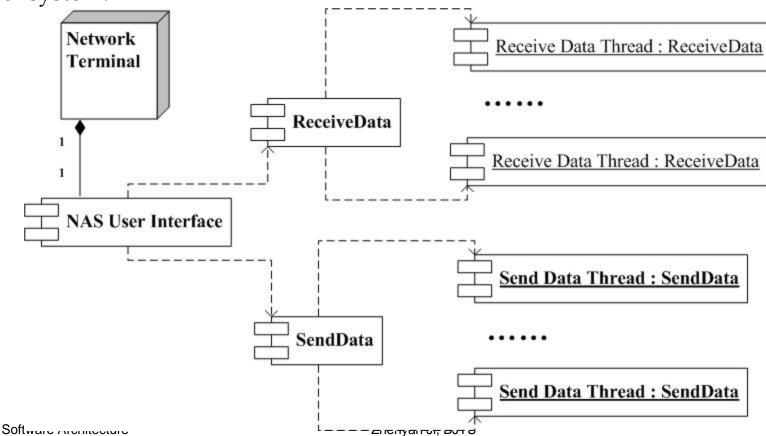

#### Process View

Zhenyan Ji, BJTU Software Architecture 11

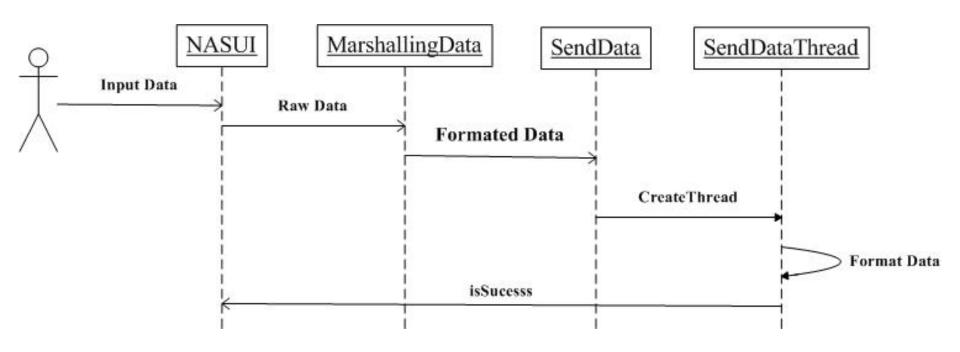

#### Physical View

The mapping relationship to the physical deployment environments of system.

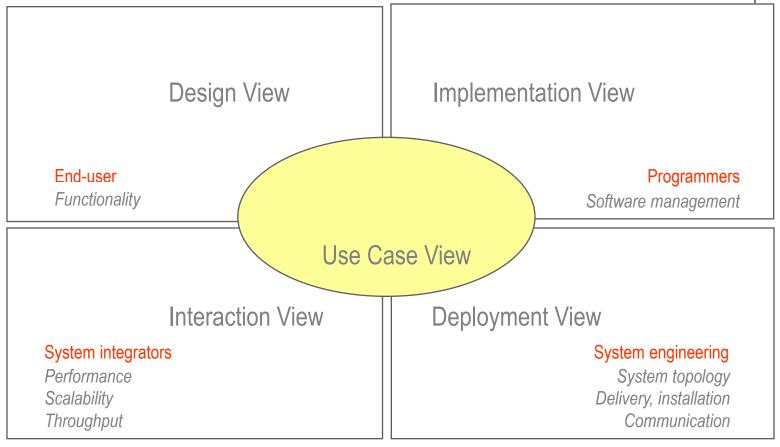

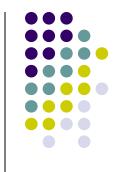

It is for describing the important system use cases.

#### Scenarios View

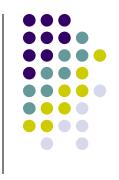

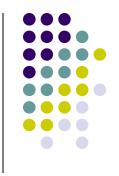

- Simplified models to fit the context
- Not all systems require all views:
  - Single processor: drop deployment view
  - Single process: drop process view
  - Very Small program: drop implementation view
- Adding views:
  - Data view, security view

- Use Case View/Scenarios
  - The use case view of a system encompasses the use cases that describe the behaviour of the system as seen by its end users, analysts, and testers.
  - The view exists to specify the forces that shape the system's architecture.

#### With UML:

- the static aspects of this view are captured in use case diagrams.
- the dynamic aspects of this view are captured in interaction diagrams, state diagrams, and activity diagrams.

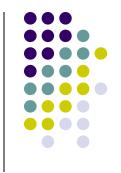

- Design View/Logic View
  - The design view of a system encompasses the classes, interfaces, and collaborations that form the vocabulary of the problem and its solution.
  - The view primarily supports the functional requirements of the system, meaning the services that the system should provide to its end users.

#### With UML:

- the static aspects of this view are captured in class diagrams and object diagrams.
- the dynamic aspects of this view are captured in interaction diagrams, state diagrams, and activity diagrams.

- Interaction View/Process View
  - The *interaction view* of a system shows the flow of control among its various parts, including possible concurrency and synchronization mechanisms.
  - The view primarily addresses the performance, scalability, and throughput of the system.
- With UML, the static and dynamic aspects of this view are captured in the same kinds of diagrams as the design view but with a focus on the active classes that control the system and the message that flow between them.

- Implementation View/Development View
  - The implementation view of a system encompasses the artifacts that are used to assemble and release the physical system.
  - The view primarily addresses the configuration management of the system's releases, made up of somewhat independent components that can be assembled in various ways to produce a running system.

#### With UML:

- the static aspects of this view are captured in artifact diagrams.
- the dynamic aspects of this view are captured in interaction diagrams, state diagrams, and activity diagrams.

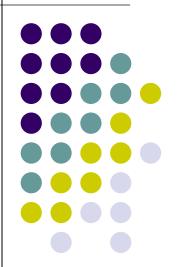

- Deployment View/Physical View
  - The deployment view of a system encompasses the nodes that form the system's hardware topology, upon which the system executes.
  - The view primarily addresses the distribution, delivery, and installation of the parts that make up the physical system.

#### With UML:

- the static aspects of this view are captured in deployment diagrams.
- the dynamic aspects of this view are captured in interaction diagrams, statechart diagrams, and activity diagrams.

# Software Architecture Modeling Tools and Languages

#### Object-oriented modeling languages

Object-oriented modeling languages started to appear sometime between the mid-1970s and the late 1980s as methodologists

The number of object-oriented models methods increased from less than 10 to more than 50 during the period between 1989 and 1994.

- ➤ Grady Booch's Booch method ---Rational Software Corporation)
- ➤ Ivar Jacobson's Object-Oriented Software Engineering (OOSE) ---Objectory
- ➤ James Rumbaugh's Object Modeling Technique (OMT) --- General Electric

#### In simple terms:

- The Booch method was particularly expressive during the design and construction phases of projects.
- OOSE provided excellent support for business engineering and requirements analysis.
- OMT-2 was expressive for analysis of data-intensive information systems.

#### Overview of the UML

- The UML is a language for
  - visualizing
  - specifying
  - constructing
  - documenting

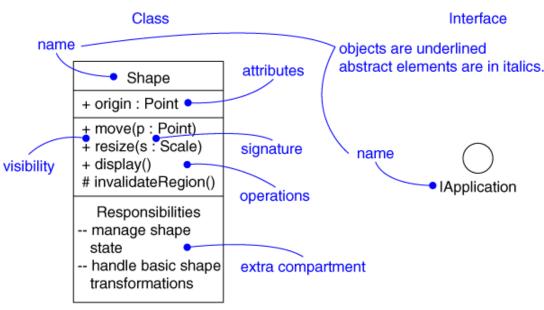

the artifacts of a software-intensive system

#### Overview of the UML

- Modeling elements
- Relationships
- Extensibility Mechanisms
- Diagrams

# Modeling Elements

- Structural elements
  - class, interface, collaboration, use case, active class, component, node
- Behavioral elements
  - interaction, state machine
- Grouping elements
  - package, subsystem
- Other elements
  - note

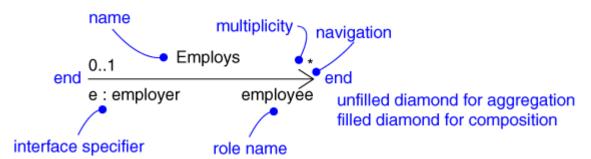

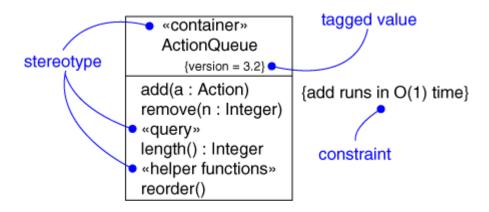

- Dependency
- Association
- Generalization
- Realization

#### Association

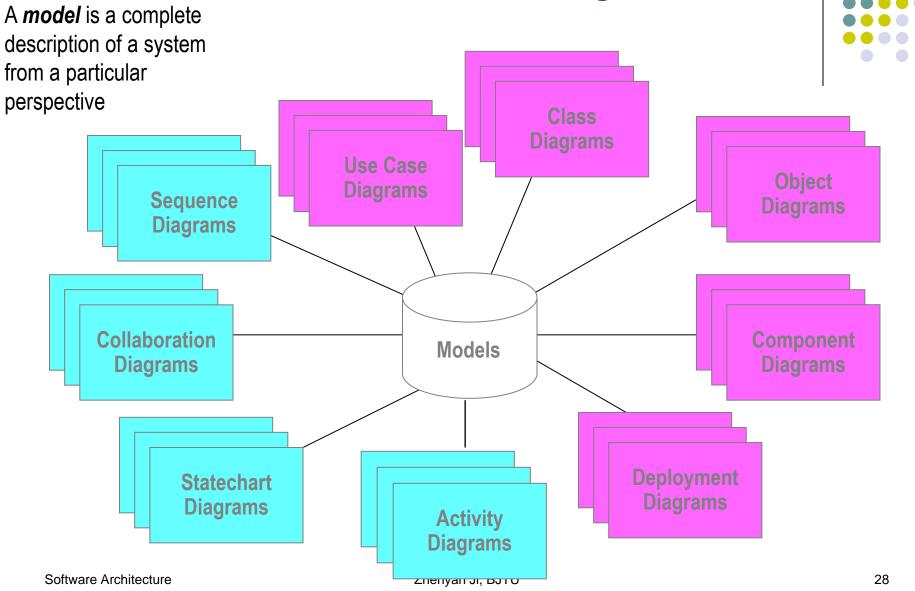

- Stereotype
- Tagged value
- Constraint

# Models, Views, and Diagrams

# Diagrams

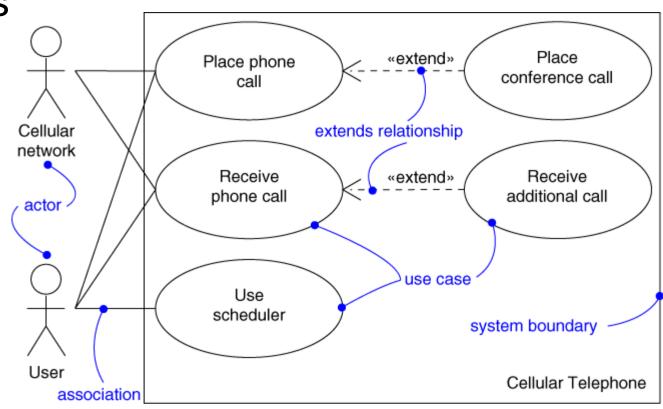

- A diagram is a view into a model
  - Presented from the aspect of a particular stakeholder
  - Provides a partial representation of the system
  - Is semantically consistent with other views
- In the UML, there are 13 standard diagrams
  - Static views: use case, class, object, component, deployment, package, composite structure
  - Dynamic views: sequence, communication, state machine, activity, timing, interaction overview

Software Architecture 29

# Use Case Diagram

Captures system functionality as seen by users

# **Use Case Diagram**

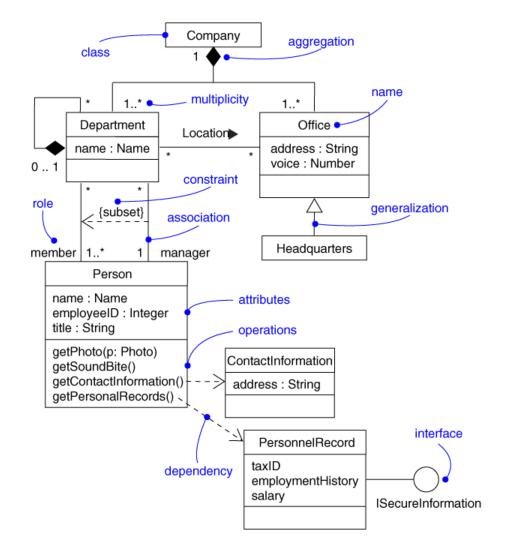

- Captures system functionality as seen by users
- Built in early stages of development
- Purpose
  - Specify the context of a system
  - Capture the requirements of a system
  - Validate a system's architecture
  - Drive implementation and generate test cases
- Developed by analysts and domain experts

# Class Diagram

Captures the vocabulary of a system

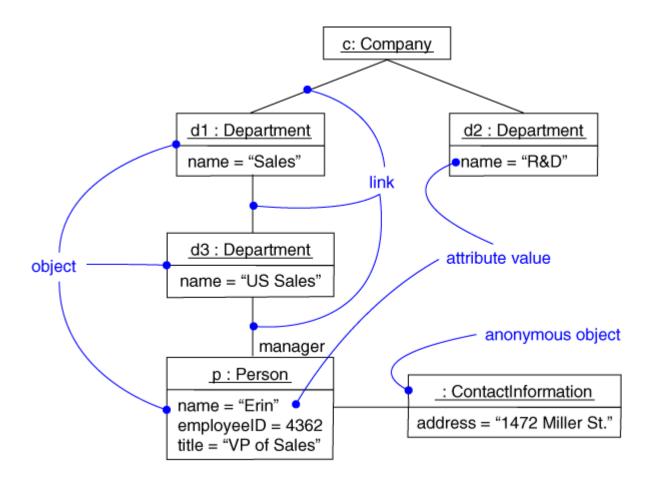

# Class Diagram

- Captures the vocabulary of a system
- Built and refined throughout development
- Purpose
  - Name and model concepts in the system
  - Specify collaborations
  - Specify logical database schemas
- Developed by analysts, designers, and implementers

# Object Diagram

Captures instances and links

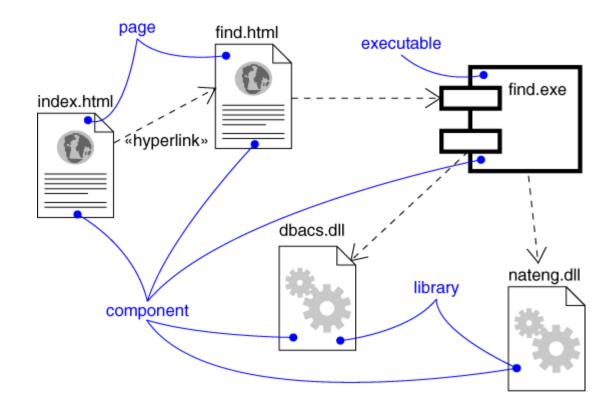

- Shows instances and links
- Built during analysis and design
- Purpose
  - illustrate data/object structures
  - Specify snapshots
- Developed by analysts, designers, and implementers

# Component Diagram

 Captures the physical structure of the implementation

# Component Diagram

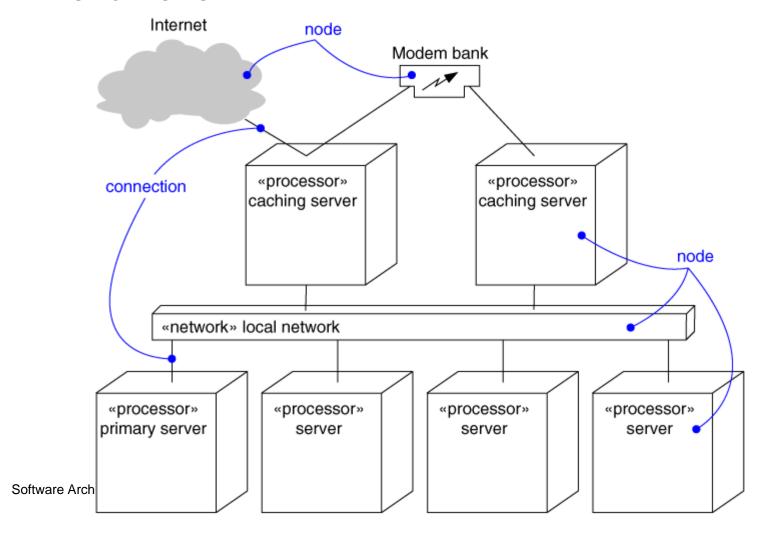

- Captures the physical structure of the implementation
- Built as part of architectural specification
- Purpose
  - Organize source code
  - Construct an executable release
  - Specify a physical database
- Developed by architects and programmers

# Deployment Diagram

 Captures the topology of a system's hardware

# Deployment Diagram

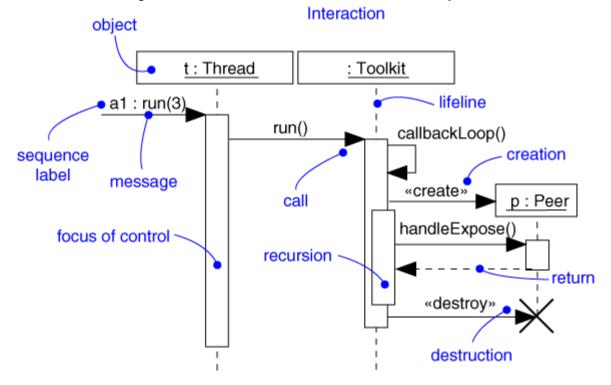

- Captures the topology of a system's hardware
- Built as part of architectural specification
- Purpose
  - Specify the distribution of components
  - Identify performance bottlenecks
- Developed by architects, networking engineers, and system engineers

Captures dynamic behavior (time-oriented)

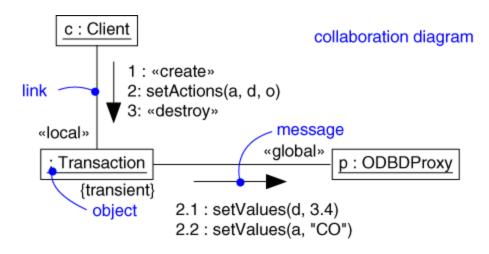

- Captures dynamic behavior (time-oriented)
- Purpose
  - Model flow of control
  - Illustrate typical scenarios

# **Communication Diagram**

 Captures dynamic behavior (messageoriented)

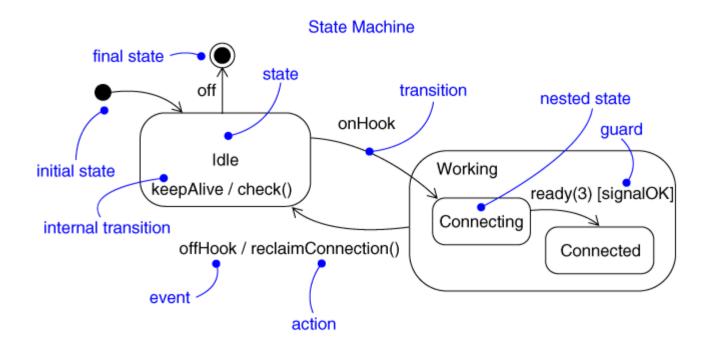

- Captures dynamic behavior (messageoriented)
- Purpose
  - Model flow of control
  - Illustrate coordination of object structure and control

# State Diagram

Captures dynamic behavior (event-oriented)

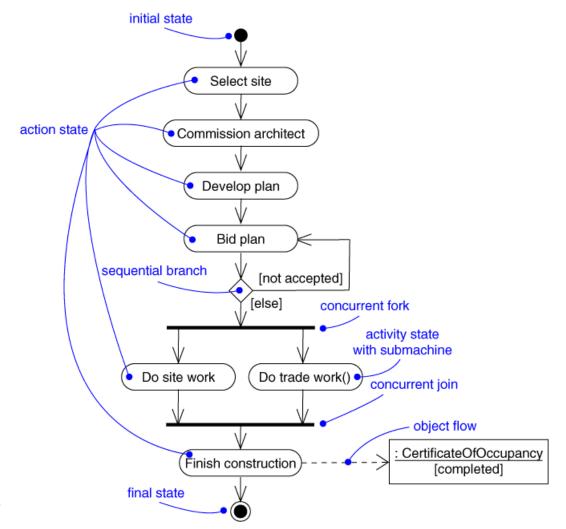

# State Diagram

- Captures dynamic behavior (event-oriented)
- Purpose
  - Model object lifecycle
  - Model reactive objects (user interfaces, devices, etc.)

# **Activity Diagram**

Captures dynamic behavior (activity-oriented)

# **Activity Diagram**

- Captures dynamic behavior (activity-oriented)
- Purpose
  - Model business workflows
  - Model operations
